IMPRESSIONS

5.61K

AVERAGE CTR

0.2%

AVERAGE POSITION

4.6

HOMEPAGE MOBILE PERF

55

ALGO PAGE MOBILE PERF

56

Executive Summary

The site is not primarily suffering from basic crawlability failure. Robots, canonicals, indexing directives, sitemap coverage, HTTPS, and baseline technical SEO are mostly present. In fact, the sampled pages scored **100/100 in Lighthouse SEO**.

The bigger problems are **CTR, query-intent fit, trust, brand clarity, and live deployment consistency**. Google appears willing to index and surface the site, but users are not clicking enough because the commercial pages are not distinct or trustworthy enough in search results, especially for finance-related queries.

Bottom Line

- Clicks are low because the snippets and page positioning do not sell the click, even when the site appears for relevant terms.
- Impressions are still limited because the domain has a small number of indexable commercial entry pages and a weak topical hub strategy.
- Trust signals are not strong enough for a YMYL finance/trading site, and some live content looks unfinished or over-claiming.
- The live website is also out of sync with stronger SEO work already present in the repo, so some intended improvements are not live.

Audit Scorecard

AREA	STATUS	AUDIT VIEW
Indexability and crawl access	MOSTLY PASS	Robots, sitemap, canonicals, and index directives are present on the main pages.
SERP clickability	WEAK	Money pages use generic or hype-led H1s, repetitive social metadata, and limited proof/trust in the search snippet layer.
Commercial page specificity	WEAK	Service pages are less structured and less differentiated than the blog pages.
Trust and E-E-A-T signals	WEAK	Finance-sensitive claims, Gmail contact, missing H1s on trust pages, placeholder contact copy, and fragmented brand naming reduce confidence.
Content hub architecture	MIXED	The main research hub is linked in navigation but intentionally noindex, limiting its value as an impression generator.
Mobile performance	POOR	Homepage LCP 24.3s and sampled money-page LCP 13.6s in mobile Lighthouse runs are far too slow for a first impression.
Deployment consistency	AT RISK	The local repo contains stronger service metadata and author structures than what is currently live.

Why Clicks Are Low

A sitewide average position of **4.6** with a CTR of only **0.2%** is a classic sign that the issue is **not just ranking**. It usually means one or more of these are happening:

- Google is showing the page, but the title/snippet is not persuasive enough to win the click.
- The query intent is only partially matched, so the result gets impressions but not trust.
- The brand is unfamiliar compared with stronger competitors in the same SERP.
- Google may be rewriting titles because the live H1 and title signals are not aligned cleanly.

Primary click-through blockers

- **Service-page search messaging is generic.** Titles are serviceable, but the live H1s are more promotional than query-matching. Example: /algo-trading-platform-india has the title "Algo Trading Platform for Indian Brokers" but the live H1 is "India's Premier Algorithmic Trading Platform."
- **Most static pages share the same OG/Twitter identity.** Homepage, money pages, about, contact, and category hub all reuse the same social title and OG URL pointing at the homepage, while the blog sample has fully page-specific metadata. That means the informational side is technically sharper than the commercial side.
- **Trust pages do not strengthen the snippet.** The live /about and /contact pages have no live H1, and the contact page exposes prose-style placeholder form text that looks unfinished when search engines surface it.
- **Brand naming is fragmented.** The ecosystem refers to Radii Labs, Layr0, Console, console.radii.in, layr0.org, and aitrade.ing. This weakens brand clarity in a SERP where users want to know exactly who they are clicking.
- **Finance claims may reduce trust.** The about page includes "Patent Pending algorithms" and "above 80 percent success rate" language without supporting proof nearby. For a finance site, that can create skepticism rather than clicks.

Why Impressions Are Still Low

The domain is being indexed, but its impression ceiling is still low because the site is not yet set up like a broad, high-authority commercial/search entity.

- **The sitemap only exposes 29 URLs.** That is a small indexable footprint for a company trying to grow across multiple trading, quant, and broker-integration themes.
- **The main research hub is noindex.** The live navigation points users and crawlers to /categories/all as "Research," but that page is intentionally excluded from indexing. This removes a natural hub page that could rank for broader topical queries.
- **Commercial pages are not yet fully schema-rich.** Blogs have specific article metadata and BlogPosting schema; service pages do not yet present the same level of page-specific structure such as Service, SoftwareApplication, or proof-led entity signals.
- **The site mixes broad macro/investment blog topics with product/service pages.** That can generate some impressions, but it dilutes focus unless the blog clusters are tightly tied back to commercial themes and expertise.
- **Freshness signaling is weak.** All sampled sitemap URLs share the same lastmod timestamp: 2026-04-11T12:39:54.540Z. That makes freshness updates look mechanical rather than page-specific.
- **Entity authority is still developing.** In trading/finance SERPs, impressions often expand only after Google sees strong expertise, clear business identity, proof, citations, backlinks, and consistent brand/product naming.

Highest-Impact Findings

PRIORITY	FINDING	WHY IT MATTERS	EVIDENCE
P0	Static service pages reuse homepage social metadata	Google and users get weaker page differentiation. Commercial pages look less distinct than blog pages.	Sampled money pages have og:title = Radii Labs AI Trading Research and Algo Execution and og:url = https://www.radii.in.
P0	Live service-page H1s are hype-led, not query-led	Low CTR and possible title rewriting risk. Searchers do not see enough exact relevance fast enough.	/algo-trading-platform-india, /forex-algo-execution-india, /risk-managed-trading-automation.
P0	Trust pages weaken trust	Finance/trading queries need stronger business credibility and cleaner user experience.	Missing H1 on live about/contact; contact prose placeholder; Gmail contact; typo "Open market Research."
P1	Main research hub is noindex	The site loses a potential topical landing page for broad research/impression queries.	/categories/all is in main nav, returns noindex, follow, and categories are excluded from sitemap generation.
P0	Mobile performance is poor	Slow first paint and LCP hurt user perception, reduce landing-page quality, and make commercial pages less competitive.	Homepage mobile: Perf 55, FCP 19.4s, LCP 24.3s. Sampled service page: Perf 56, FCP 11.5s, LCP 13.6s.

PRIORITY	FINDING	WHY IT MATTERS	EVIDENCE
P1	Repo and live site are not aligned	Some of the intended CTR and author-credibility upgrades appear not to be deployed, limiting their SEO impact.	Local repo has stronger service metadata and author/methodology blocks than what the live site renders.

Technical Reality: This Is Not a “Google Cannot Crawl Me” Problem

The sampled pages are indexable, canonicalized, HTTPS-enabled, and structured well enough to score **100/100 in Lighthouse SEO**. That matters because it narrows the diagnosis: the site needs **better click-winning SERP assets and stronger authority/trust signals**, not just more titles and canonicals.

SAMPLE	PERFORMANCE	ACCESSIBILITY	BEST PRACTICES	SEO	NOTES
Homepage	55	91	79	100	Very slow mobile rendering despite technically complete SEO basics.
/algo-trading-platform-india	56	100	79	100	Same pattern: technically indexable, but not compelling enough at the snippet/trust layer.

Page-Level Observations

URL	LIVE TITLE / H1	MAIN ISSUE
/	Title and H1 align reasonably	Homepage is blog-forward and brand-forward, but not especially proof-forward. Slow mobile load worsens the first impression.
/algo-trading-platform-india	Title is commercial, H1 is promotional	Query mismatch risk; generic social metadata; commercial page not obviously stronger than competitors from the snippet alone.
/multi-broker-order-routing	Title is decent, H1 is abstract	One of the better-aligned pages, but still uses homepage social metadata and lacks stronger commercial proof signals.
/forex-algo-execution-india	Title is commercial, H1 is "Dominating Global Forex from India"	High hype, low trust. For regulated/finance-sensitive queries, this language can reduce confidence and clicks.
/quant-research-services-india	Title is specific, H1 is broad	Better than the hype pages, but still uses generic static-page social metadata and light trust proof.
/risk-managed-trading-automation	Title is good, H1 is "Automated Discipline, Every Trade"	Strong concept, but commercial searchers would likely respond better to explicit software/risk-control wording in the visible headline.
/about	No live H1 detected	Contains "80 percent success rate" claim, no strong leadership/entity proof, and fragmented product naming.
/contact	No live H1 detected	Form uses unfinished conversational placeholder text that leaks into snippets and reduces trust.
/categories/all	noindex, follow	Main nav hub is intentionally excluded from indexing, which caps category-level impression growth.
Blog sample	Specific title, H1, OG, Twitter, Article metadata	The blog template is more SEO-complete than the service-page template, which is the opposite of the ideal commercial SEO setup.

What To Fix First

PRIORITY	ACTION	EXPECTED SEO EFFECT
1	Deploy the repo's stronger service metadata and verify the rendered live HTML, not just source code.	Improves title specificity, SERP clarity, and commercial relevance quickly.
2	Rewrite live service-page H1 and hero copy to match query intent directly and reduce hype language.	Improves CTR and lowers title-rewrite risk.
3	Clean up about/contact trust signals: real business email, remove/justify aggressive claims, add proper H1s, fix typos, replace placeholder copy.	Improves YMYL trust, user confidence, and click willingness.
4	Decide whether the research hub should become indexable and optimized instead of living as a nav-linked noindex page.	Raises broader-topic impression potential.
5	Add page-specific Service / SoftwareApplication schema on money pages.	Improves commercial entity clarity and structured understanding.

PRIORITY	ACTION	EXPECTED SEO EFFECT
6	Reduce mobile render delay and above-the-fold weight on homepage and money pages.	Supports rankings, engagement, and landing-page quality.
7	Tighten blog clusters around service intents instead of broad low-conversion macro topics alone.	Improves topical authority and impression quality.

Expected Outcome If The Right Changes Ship

- The first improvement should appear in CTR, not just rankings, especially on the five money pages already called out in the repo.
- Impression growth should follow after Google sees clearer commercial structure, better trust pages, and more consistent internal topical architecture.
- If nothing changes but the site keeps publishing more broad blogs, impressions may grow slowly, but qualified clicks will likely stay weak.

Evidence Appendix

Search Console context supplied

- 13 clicks
- 5.61K impressions
- 0.2% CTR
- Average position 4.6
- View appears to be the last 28 days, approximately May 10, 2026 through June 6, 2026

Sitemap and crawl notes

- Sitemap index points to a single sitemap file.
- Sampled sitemap URL count: **29**
- Sampled sitemap entries all shared the same lastmod value: 2026-04-11T12:39:54.540Z
- Main navigation research hub is live but noindexed:
<https://www.radii.in/categories/all>

Sample metadata matrix

URL	ROBOTS	OG TITLE BEHAVIOR	H1 NOTE
/algo-trading-platform-india	index, follow	Reuses homepage OG title and homepage OG URL	Commercial title, promotional H1
/multi-broker-order-routing	index, follow	Reuses homepage OG title and homepage OG URL	Abstract H1
/forex-algo-execution-india	index, follow	Reuses homepage OG title and homepage OG URL	Hype-led H1
/about	index, follow	Reuses homepage OG title and homepage OG URL	No live H1 detected
/contact	index, follow	Reuses homepage OG title and homepage OG URL	No live H1 detected
Blog sample	index, follow	Own OG title, own OG URL, article type	Strong, explicit H1

Performance sample

PAGE	FCP	LCP	SPEED INDEX	NOTES
Homepage mobile Lighthouse	19.4s	24.3s	19.4s	Google Tag Manager accounted for roughly 159.1 KB of third-party transfer in the sample.
/algo-trading-platform-india mobile Lighthouse	11.5s	13.6s	11.5s	Still materially too slow for a commercial landing page.

Repo vs live-site drift noted

- Local file `src/utils/servicePages.js` contains more specific broker-targeted metadata than the live sampled service pages currently render.
- Local file `src/app/blogs/[slug]/page.js` includes richer author and methodology presentation than what the live blog sample currently exposes in structured data.
- Local file `src/app/categories/[slug]/page.js` intentionally sets category pages to `noindex`, which is currently visible in the live hub page.
